

4-story main distribution box

Article Overview

A four-story main distribution box (MDB) serves as the central hub for distributing electricity from a single input source to all floors, with sub-distribution boards on each floor for branch circuits.

Overview of Main Distribution Box (MDB)

The Main Distribution Board (MDB) is the primary low-voltage distribution point in a building, typically installed on the ground floor for easy access in emergencies. It receives power from the utility or transformer and distributes it to sub-distribution boards (SDBs) or directly to floor-level distribution boards (DBs) in a multi-story building . The MDB houses key components such as:

- Busbars for conducting and distributing power to multiple circuits
- Main circuit breakers or MCCBs to protect against overloads
- Residual current devices (RCCB/RCBO) for leakage protection
- Surge protective devices (SPD) to guard against voltage spikes
- Switches/isolators for maintenance and emergency shut-off

Distribution in a Four-Story Building

For a four-story building, electricity can be distributed in two common ways:

- Separate Energy Meters per Floor: Each floor has its own meter and distribution board. Power is drawn from the meter to the floor's main switch and distribution board, then branch circuits supply lights, sockets, and appliances . This method allows independent control and billing for each floor....
