

Cable tray width 250

Article Overview

A 250 cable tray has a width of 250 millimeters.

The 250 cable tray refers to the nominal width of the tray, which is the internal usable width for laying cables, measured in millimeters. This width is standard for wire mesh or welded steel cable trays, such as the BFR Series, which are commonly used in industrial, commercial, and data center installations for routing electrical and communication cables efficiently .

Additional Considerations

- Depth and Height: While the width is 250 mm, the tray's depth (side rail height) can vary depending on the manufacturer and load requirements. Depth affects cable stacking capacity and heat dissipation .
- Length: Standard cable tray sections are typically 3 meters long, which simplifies transport and installation .
- Cable Fill: For safety and compliance, cable trays are usually filled to no more than 40-50% of their cross-sectional area to allow airflow and prevent overheating .
- Material and Type: The 250 mm width is available in various tray types, including ladder, perforated, and wire mesh, each suited for different mechanical and electrical needs . When selecting a 250 mm cable tray, ensure that the number and size of cables planned for installation fit within the tray's usable width while maintaining proper spacing and ventilation.
