

Distance requirements for 10kV power cables and optical fibers

Overview

Industry standards such as ANSI/TIA-568 and ISO/IEC 11801 provide the following guidelines: Unshielded Power Cables: 50 mm (2 inches) for up to 2 kVA power cables. Best Practice: Unshielded data cable vs. power cable requires 12 inches of separation unless a listed barrier or separate raceway is used. This safety zone also mitigates most EMI, and power induction. Separation isn't just an EMI precaution — it protects signaling, reduces rework, and ensures pathways meet inspection expectations across risers. Maintain Minimum Separation Distances The separation distance between power and data cables is critical to minimizing EMI. This article explains calculation methods, practical examples, normative references, and recommended calculator features for engineers.
