

Distribution box 50 cable

Article Overview

A 50A cable can be safely connected to a distribution box by using an appropriately rated main MCB, RCCB, and proper cable sizing, ensuring secure phase, neutral, and earth connections.

Main Feeder Cable Selection

For a 50A load, the main incoming cable should have a cross-sectional area sufficient to handle the current without overheating. Typically, a 10–16 mm² copper cable is used for single-phase 50A circuits, depending on the installation method and insulation type. Both phase and neutral wires must be connected from the supply to the input of the main MCB.

Distribution Box Components

- **Main MCB (Double Pole):** Acts as the main switch and protects the entire distribution board. For a 50A supply, a 50A DP MCB is recommended.
- **RCCB (Residual Current Circuit Breaker):** Provides protection against earth faults. Connect the output of the main MCB to the input of the RCCB.
- **Single-Pole MCBs:** Used for individual sub-circuits. Connect the phase wire from the RCCB output to each SP MCB input, and the neutral to the neutral bus bar.
- **Earth Link:** Connect the earth wire from the supply and all loads to the earth terminal in the distribution box.

Wiring Steps

- Turn off the main supply before starting any connections....
