

High-strength lightweight cable tray processing price

Article Overview

High-strength, lightweight cable trays, such as fiberglass FRP trays, offer steel-comparable load capacity at a fraction of the weight, with prices influenced by material, size, customization, and installation requirements.

Material and Manufacturing

High-strength lightweight cable trays are often made from fiberglass-reinforced plastic (FRP), produced via an automated pultrusion process. This involves impregnating continuous glass fibers with polyester resin, flame-retardant additives, and surface felts, followed by high-temperature curing to form a continuous tray. These trays are lightweight (about one-quarter the weight of steel), corrosion-resistant, flame-retardant, and suitable for indoor and outdoor installations, including subways, underground garages, and industrial facilities. Some designs integrate titanium or copper mesh for electromagnetic interference (EMI) shielding.

Price Influencing Factors

The processing price of these cable trays depends on several factors :

- Material type: FRP, aluminum, or steel; FRP is lighter but may cost more per meter than standard steel.
- Load-bearing capacity: Higher capacity trays require thicker or reinforced materials.
- Dimensions and length: Wider or longer trays increase material usage and cost....
