

How to reset a router in a fiber optic network

Article Overview

You can reset a fiber optic router or ONT by performing a soft reset (power cycle) or a hard reset (factory reset), following careful steps to avoid data loss and restore connectivity.

Understanding the Devices

In a fiber optic network, your router is often connected to an ONT (Optical Network Terminal), which converts optical signals from your ISP into electrical signals for your devices . Resetting either device can resolve issues like slow internet, intermittent connectivity, or configuration conflicts .

Soft Reset (Power Cycle)

A soft reset is the simplest method and usually resolves minor issues:

- Power off the device: Unplug the power cord from your router or ONT. Do not unplug the fiber optic cable itself .
- Wait: Allow 30-60 seconds for the device to discharge and clear temporary glitches .
- Power on: Plug the power cord back in and wait for the device to boot up. This may take a few minutes as the device reconnects to your ISP .
- Verify connectivity: Check that your devices can access the internet and that speeds are stable
