

KVM Switcher Shared by Multiple Devices

Article Overview

A KVM switch can allow multiple computers to share a single set of peripherals, and combining it with a USB hub or docking station can expand device support.

Basic KVM Functionality

A KVM (Keyboard, Video, Mouse) switch lets you control multiple computers using one keyboard, mouse, and monitor, reducing clutter and simplifying multitasking . Modern KVM switches support high-resolution displays, dual-monitor setups, USB 3.0 peripherals, and audio devices, making them suitable for both professional and home environments . Switching between computers can be done via a button on the switch or a keyboard shortcut.

Sharing Multiple Devices Beyond Standard KVM Ports

Standard KVM switches have a limited number of USB ports, which may not accommodate all your peripherals. To share additional devices like external drives, webcams, or printers, you can:

- Use a USB hub connected to the KVM switch. A self-powered hub allows multiple devices to be shared without overloading the KVM's USB ports .
- Combine a docking station with a KVM switch. Connect all peripherals to a USB 3.0 docking station, then link the dock to a USB switch that toggles between computers. This setup allows a single button press to switch all devices simultaneously .

Considerations and Limitations...
