

KVM switch shows no signal when turned on

Article Overview

A "no signal" message on a KVM switch usually stems from power issues, cable problems, resolution incompatibility, or device handshaking conflicts.

Check Power and Connections

Ensure the KVM switch is properly powered and the power indicator light is on. Verify that all cables connecting the KVM to your computers and monitors are securely plugged in and functioning. If the switch has a power adapter, try replacing it to rule out a faulty adapter. Power cycling the KVM, monitors, and connected computers can often resolve temporary signal issues .

Verify Input Source and Channel

Confirm that the input source (computer) is powered on and that the KVM is switched to the correct channel corresponding to that source. Testing the monitor and computer directly, bypassing the KVM, can help determine if the issue is with the KVM or the cables .

Adjust Resolution and Refresh Rate

Some KVM switches have limitations on supported resolutions and refresh rates. If the monitor works when connected directly but not through the KVM, try lowering the output resolution (e.g., 720p or 1080p) and reconnecting. Ensure the KVM supports...
