

Rated current of laser diode

Overview

Light-current-voltage (L-I-V) characteristics are used to determine the laser's operating point. In other words, they determine drive current at the rated optical power and the threshold current where lasing begins. Usually, a “laser diode module” is a combination of a laser diode and a photo detector (PD). This system of ordinary differential equations relates the number or density of photons and charge carriers (electrons) in the device to the injection current and to device and material parameters such as. The most important laser diode characteristic is how its light output power (L) responds to injected current (I). One of the most commonly used and important laser diode specifications or characteristics is its L/I curve. Diode lasers have been called “wonderful little devices.”
