

Safe distance between gas pipes and electrical distribution boxes

Overview

Both the National Electrical Code (NEC) and the National Fuel Gas Code (NFPA 54) generally require a minimum horizontal separation of 12 inches (one foot) between underground electrical service raceways and gas service lines when they run parallel. These regulations minimize potential hazards that arise when the two utility systems are in close proximity during new construction or renovation. Adhering. The standard electrical code distance from a gas line is a minimum of 6 inches (150 mm) for general separation, though a 12-inch gap is widely considered best practice. ' Segregation distances between gas and electrical intakes are given. Gas pipes should also be at least 150mm from electrical supply equipment such as electric metering equipment, service cut-outs, main isolation switches or consumer units. These include the circuit type, cables' strength, and the risk from these appliances.
