

Small busbar fixing component appearance

Article Overview

Small busbar fixing components typically appear as insulated copper strips with protruding pins or mounting holes, designed to attach directly to PCBs or panel systems.

Physical Design

Small busbars are often insulated copper strips that span across a PCB or within a control panel, providing a dedicated high-current path. They usually have protruding connection pins along their edges, which fit into through-holes on the board, similar to standard through-hole components, ensuring secure electrical and mechanical attachment (EEWorld Online) . Some designs include mounting holes or tabs to fix the busbar to the board or panel, enhancing rigidity and preventing movement under vibration or thermal expansion (Mersen) .

Material and Insulation

The conductive part is generally solid copper, sometimes laminated for multi-layer designs, to handle high currents with minimal resistance. Insulation is applied to prevent accidental short circuits and to protect against contact hazards. In modular panel systems, busbars may also include cover systems for additional safety (Rittal) .
