What does STM stand for in optical modules

Article Overview

STM in optical modules primarily stands for Synchronous Transport Module, a standard in Synchronous Digital Hierarchy (SDH) for fiber optic networks.

Definition and Context

STM (Synchronous Transport Module) is a key concept in SDH (Synchronous Digital Hierarchy), which is a standardized protocol for transmitting digital signals over optical fiber networks. STM defines the data rate and frame structure for optical modules, ensuring synchronized, high-speed, and reliable data transfer . The base level, STM-1, has a bit rate of 155.52 Mbps, and higher levels such as STM-4, STM-16, STM-64, and STM-256 increase by multiples of 4 . Each STM frame is structured to carry multiple channels, including voice, data, and signaling information.

Alternative Meanings in Optical Networking

In some telecommunications contexts, STM can also refer to:

• Synchronous Transfer Mode: A method for transferring data in a synchronous manner, ensuring low latency and high data integrity .
• Synchronous Time Multiplexing: A technique to transmit multiple signals over a single communication channel by dividing time slots among them . These definitions are closely related to SDH and optical module operation, as they describe how data is organized and transmitted over fiber networks....
