

Most electrical distribution boxes in Singapore are located inside HDB flats near the main entrance or utility areas, while external DB boxes are installed outside flats to manage building-wide electricity distribution.

In residential units such as HDB flats, distribution boxes (DB boxes) are typically installed inside the flat near the main entrance or in utility rooms. This placement ensures easy access for maintenance, repairs, and upgrades while keeping the box away from water sources and heat . The DB box houses the main switch, miniature circuit breakers (MCBs), and residual current devices (RCCBs), which regulate and protect the electrical circuits within the home . Proper installation follows strict safety regulations, and licensed electricians are required to mount the box at an appropriate height, usually at eye level, for convenient access .

Outside HDB flats, electrical boxes are installed on the building exterior to serve as a central hub for distributing electricity from the main supply to individual units . These external DB boxes contain the main circuit breaker, RCCB, and other protective devices, ensuring safe and efficient electricity flow to each flat. They are also connected to the building's earthing system to prevent electric shocks and are maintained according to Building and Construction Authority (BCA) regulations
